Sergey Volynkin

Software Implementation & Support Engineer

· Saint Petersburg

Email: **volynkin.s04@gmail.com**

Telegram: **@volynkin_s**

GitHub: **github.com/volynkinss**

Phone: **+7 (999) 022-60-61**

I implement and support applications on Linux: Docker deployment, service integrations, troubleshooting and open-source customization. At IBK, I support a remote-access gateway serving 70–100 users daily and integrate applications with Keycloak. Python development and changes to existing Go codebases help me automate operations and resolve application issues. My most complex project to date is Supplier Price Parser / Price Order, currently in active development with Codex assistance.

Saint Petersburg: office or hybrid; also open to remote and contract work. Russian and international companies; relocation with employer support.

Key competencies

Implementation and operations

Application deployment and troubleshooting on Linux.

· Linux · Docker · Docker Compose · Nginx · reverse proxy · Prometheus · Grafana · Loki

Integrations and data

Authentication, service access, APIs and databases.

· Keycloak · SAML 2.0 · OIDC · REST APIs · PostgreSQL · SQLAlchemy · Alembic · SQLite · Redis

Automation and software changes

Python development, existing Go code changes, application builds and delivery.

· Python · FastAPI · async I/O · Go — open-source customization · CI/CD · GitHub Actions · Pulp — implementation in progress

Additional project experience

TypeScript/NestJS/React, geospatial tools and LLM APIs in AI-assisted projects. Kubernetes, Helm and werf: basic exposure through individual deployment tasks.

· TypeScript · NestJS · React/Next.js · PostGIS · OSRM · RabbitMQ · Taskiq · aiogram · TON integrations · LLM APIs

· Codex — scoped development and change review

Work experience

IBK LLC

Lead System Administrator

Sep 2025 — Present

Import Substitution Solutions Department

Implement and support open-source solutions in a six-person engineering team. My scope covers Linux operations, deployment, application and identity integrations, troubleshooting and source code changes.

RDPGW

Open-source customization · remote access

Production · 70–100 daily users

- Added terminal farm / RDS collection support to an existing Go gateway, plus SQLite-backed connection history, active-session views and filtered Excel export.
- Build, deploy and support this business-critical gateway for remote work; investigate authentication and connection issues.

· Go · Linux · Docker · SQLite · OIDC

Dashboard

Internal service catalog

- Built a FastAPI portal with a PostgreSQL service catalog, Dashy YAML import and a bilingual interface.
- Integrated Keycloak/OIDC sign-in, group-based service visibility, persistent sessions and audit logging; packaged the portal with Docker Compose.

· Python · FastAPI · Jinja2 · PostgreSQL · Keycloak · Docker Compose

Source on GitHub (https://github.com/volynkinss/dashboard)

Pulp

Package and artifact repositories

In progress

- Evaluate and deploy Pulp in Docker: repositories, remotes, distributions, reverse proxy and authentication integration.
- Design the operating model for upstream retrieval and local artifact reuse, including serving previously downloaded artifacts without external internet access.

· Pulp · Docker · Reverse proxy

Keycloak

Application identity integration

- Administer Keycloak and integrate applications with SAML 2.0 and OIDC together with my manager.
- Troubleshoot SAMLResponse assertions, NameID and attribute mapping, ACS flows and service provider / identity provider interactions.

· Keycloak · SAML 2.0 · OIDC

Automated export of Postman API collections and environments for migration to Hoppscotch.

Earlier experience outside IT

M.Video-Eldorado

Sales Associate, then Sales Floor Manager

Aug 2016 — Sep 2022

Around three years managing teams of up to 20 people: organizing daily work, coordinating staff and overseeing sales-floor operations.

Selected projects

Projects outside my IBK role: a co-owned product and my own services built for clients.

Supplier Price Parser / Price Order

Client project

Project owner · requirements, development and deployment

In active development

My most technically complex project to date: a client system for processing supplier price lists and Telegram messages, matching products and preparing orders.

Developed with substantial Codex and AI assistance: I define task scope and acceptance criteria, review generated changes, run relevant checks and validate operator workflows.

- Telegram and XLSX ingestion, price-list normalization and background processing form a workflow from source data to catalog matching and order preparation.
- A protected operator workspace supports review and manual catalog matching. LLM-assisted matching through OpenRouter proposes candidate products; decisions require explicit operator confirmation.
- PostgreSQL stores source snapshots and audit history, preserving the input data and recorded processing decisions.

· Python · FastAPI · PostgreSQL · Telegram · OpenPyXL · XLSX · OpenRouter · LLM APIs · Codex · Docker Compose · GitHub Actions

BoltFather

Co-owned product · 25% ownership

Co-owner · backend development and operations

Feb 2024 — Present

Production

Telegram community access and subscription service with TON integrations.

Code written manually.

- Rewrote the product and continue to develop its backend, bot and infrastructure, including deployment and operations.
- Automated delivery with GitHub Actions, GHCR images, SSH deployment, Alembic migrations and Docker Compose.
- Deployed Prometheus, Grafana and Loki/Promtail for application metrics and Docker logs; added operational reporting backed by PostgreSQL.

· Python · FastAPI · aiogram · PostgreSQL · Redis · Docker Compose · GitHub Actions · Prometheus · Grafana · Loki

BoltFather website (https://boltfather.com/)

Kvartirka

Client project

Project owner · development and deployment

In client use · being refined

A workspace for managing rental properties, bookings and financial records.

Code developed with substantial assistance from AI tools.

- The NestJS/Fastify API and Next.js interface cover properties, bookings, payments, expenses and documents, with Prisma/PostgreSQL and Redis.
- The project includes portfolio financial workflows, Docker Compose deployment, health checks and smoke validation through GitHub Actions.

· TypeScript · NestJS · Next.js · React · Prisma · PostgreSQL · Redis · Docker Compose · GitHub Actions

Project website (https://rentalkeeper.ru/)

Deliveries

Client project

Project owner · development and deployment

Jan 2025 — Present

Development complete · in client use

Delivery planning with geographic zones, address processing and route calculation.

Code developed with substantial assistance from AI tools.

- The FastAPI/PostGIS backend and React map support address imports, geocoding, courier workflows and access control.
- The project integrates OSRM routing, H3 zone recommendations for review and LLM fallback parsing of delivery text, with Docker and CI/CD workflows.

· Python · FastAPI · PostgreSQL · PostGIS · React · TypeScript · OSRM · H3 · Docker · GitHub Actions

Other engineering projects

User Balances

FEB 2025 — JUL 2025

Backend development for TON data processing: service APIs, block parsing, queue workers and database models.

· FastAPI · PostgreSQL · Redis · RabbitMQ · Taskiq

Scale API

MAR 2025 · PROJECT CLOSED

Developed an API and background synchronization for staking and on-chain data.

· FastAPI · PostgreSQL · Alembic · Docker

Printly3D

AUG 2025 — NOV 2025 · PROJECT CLOSED

Developed a Telegram bot and backend for 3D-printing order workflows.

· Python · aiogram · PostgreSQL · Alembic · Docker

Token Prices

Built token price monitoring and Telegram notifications with TON integrations, Redis state and automated Docker deployment.

· aiogram · Redis · TON APIs · Docker

Fanton Rent

APR 2025 — OCT 2025 · PROJECT CLOSED

Developed a bot for in-game asset rentals, integrating the Fanton API with wallet and reservation workflows.

· Python · aiogram · Redis · TON APIs · GitHub Actions

Education

Saint Petersburg State Institute of Technology (Technical University)

Bachelor’s degree · Applied Informatics · 2017

Languages: Russian. English: read texts with occasional translation of unfamiliar words; can explain a viewpoint in simple terms.
